Summary

The American Trends Panel (ATP) is a national, probability-based online panel of adults living in households in the United States. On behalf of the Pew Research Center, Ipsos Public Affairs ("Ipsos") conducted the 63rd wave of the panel from March 2 to March 15, 2020. In total, 3,194 ATP and 446 Knowledge Panel (KP) members (both English- and Spanish-language survey-takers) completed the Wave 63 survey. Survey weights were provided for the total responding sample. The margin of sampling error for weighted estimates based on the full sample is ± 2.2 percentage points.

Sample Definition

The overall target population for Wave 63 was parents who have their own children age 17 or under in their household, living in the US, including Alaska and Hawaii. The sample consisted of 4,513 ATP members who were parents of children under 18 and 1,000 KP members that indicated they were parents of children under 12 in their respective profile survey and were still active.

KnowledgePanel Methodology Information

KnowledgePanel is the largest online panel that relies on probability-based sampling techniques for recruitment; hence, it is the largest national sampling frame from which fully representative samples can be generated to produce statistically valid inferences for study populations. KP provides samples with the highest level of representativeness available in online research for measurement of public opinions, attitudes, and behaviors. The panel was first developed in 1999 by Knowledge Networks. Panel members are randomly selected so that survey results can properly represent the U.S. population with a measurable level of accuracy, features that are not obtainable from nonprobability panels (for comparisons of results from probability versus nonprobability methods, see Yeager et al., 2011[1]).

KnowledgePanel's recruitment process was originally based exclusively on a national RDD sampling methodology. In 2009, in light of the growing proportion of cellphone-only households, Ipsos migrated to an ABS recruitment methodology via the U.S. Postal Service's Delivery Sequence File (DSF). ABS not only improves population coverage, but also provides a more effective means for recruiting hard-to-reach individuals, such as young adults and minorities. Households without Internet connection are provided with a Web-enabled device and free Internet service.

After initially accepting the invitation to join the panel, participants are asked to complete a short demographic survey (the initial *Core Profile Survey*); answers to this survey allow efficient panel sampling and weighting for future surveys. Upon completing the Core Profile Survey, participants become active panel members. All panel members are provided privacy and confidentiality protections.

Questionnaire Development and Testing

The questionnaire was developed by the Pew Research Center in consultation with Ipsos. The web program was rigorously tested on both PC and mobile devices by the Ipsos project management team and Pew Research Center researchers. The Ipsos project management team also populated test data which was analyzed to ensure the logic and randomizations were working as intended before launching the survey. The Pew Research Center has a copy of the final instruments in English and Spanish.

Recruitment and Administration of the ATP

Prior to Wave 63, ATP panelists were recruited from three large (n=10,013, n=6,004 and n=3,905), national, overlapping, dual-frame landline and cellphone random-digit-dial (RDD) surveys and two (n=9,396 and n=5,900) national address-based sample (ABS) survey conducted for the Pew Research Center. At the end of each recruitment survey, respondents were invited to join the panel. The first recruitment was conducted from January 23 to March 16, 2014, the second recruitment was conducted from August 27 to October 4, 2015, the third recruitment was conducted from April 25 to June 4, 2017, the fourth recruitment was conducted from August 8, 2018 to October 31, 2018, and the fifth recruitment was conducted August 19, 2019 to November 30, 2019, all in English and Spanish. Sample for the RDD surveys was obtained from SSI and sample for the ABS survey was obtained by MSG. The RDD recruitment surveys were conducted by Abt SRBI.[2]

The first 20 waves of the ATP featured a simultaneous mixed-mode design, in which panelists who used the Internet and provided an email address participated via self-administered web survey, and adults who did not use the Internet (or did but did not provide an email address) participated via a mail survey (Waves 3-4 and 6-20) or computer-assisted telephone interviewing (CATI, Waves 1 and 5 only). Wave 18 was the first wave where a subset of the non-Internet panelists was converted to web mode. The conversion process involved calling all active mail mode respondents (n=616) and asking them to report their Internet and device

status and then asking them to convert to web. Those who already had the means for taking web surveys were simply asked to convert. Those without the means for taking web surveys (no device and/or Internet access) were offered an Internet-connected tablet computer at no cost to the panelist. Tablets were shipped to the panelists who accepted, and they were given a follow-up call to ensure they understood how to use the tablet to access the ATP surveys through a pre-installed Mobile Panel Application.

Wave 21 was the first wave conducted only in web mode. However, the conversion effort was ongoing through Wave 26. By Wave 26, 238 of 616 (39%) mail panelists had converted to web. Of these, 197 received tablets and 41 made the mode switch using their own devices.

Data Collection Protocol

The data collection field period for Wave 63 was March 2, 2020 to March 15, 2020. Postcard notifications were mailed to all ATP panelists with a known residential address on March 2, 2020.

On March 2 and March 3 invitations to Wave 63 were sent out in two separate launches: Soft Launch and Full Launch. One hundred panelists were included in the soft launch which began with an initial invitation sent on March 2, 2020. The ATP panelists chosen for the initial soft launch were known responders who had completed previous ATP surveys within one day of receiving their invitation. All remaining English panelists were included in the full launch and were sent an invitation on March 3, 2020.

All panelists with an email address received an email invitation and up to three email reminders if they did not respond to the survey. All ATP panelists that consented to SMS messages received an SMS invitation and up to three SMS reminders.

Invitation and Reminder Dates for Wave 63 Panelists

	Soft Launch	Full Launch
Advance Post Card	March 2, 2020	March 2, 2020
Initial invitation	March 2, 2020	March 3, 2020
1st reminder	March 5, 2020	March 6, 2020
2nd reminder	March 9, 2020	March 9, 2020
3rd reminder	March 11, 2020	March 11, 2020

ATP panelists who completed their survey in Spanish and all converted panelists who had received a tablet were offered a $20 post-paid incentive for completing the Wave 63 survey.

Panelists who were age 18-29, African American, with high school education or less, were not registered to vote, or reported being Hispanic but taking the survey in English in the RDD recruitment survey were offered a $10 post-paid incentive for completing the Wave 63 survey. All other panelists who completed the survey were offered a $5 post-paid incentive. Respondents could choose to receive the post-paid incentive in the form of a check or a gift code to Amazon.com or could choose to decline the incentive. The differential incentive amounts were designed to increase panel survey participation among groups that traditionally have low survey response propensities.

Data Quality Checks

As part of the effort to ensure the highest quality data, the Pew Research Center researchers performed data quality checks to identify any respondents showing clear patterns of satisficing. Pew Research Center removed one KP respondent from the Wave 63 data. No panelists were withdrawn from the panel completely.

Weighting

Survey weights are needed to support reliable inference from the panel to the target population of US adults. The final survey dataset contains a total sample weight variable (WEIGHT_W63). The design of this weight is described below.

Starting with the base weights of ATP sample, respondents are weighted to represent parents who have their own children age 17 or under in their household with respect to the following characteristics:

- Gender (Male, Female) x Age (18-24, 25-34, 35-44, 45-54, 55-64, 65+)
- Gender (Male, Female) x Education (HS grad or less, Some college, College grad +)
- Age (18-34, 35-54, 55+) x Education (HS grad or less, Some college, College grad +)
- Race/Ethnicity (White Non-Hispanic, Black Non- Hispanic, Hispanic, Other/Multi-race Non- Hispanic) by Education (HS grad or less, Some college, College grad +) and education is not broken out (but collapse) within Other/Multi-race Non- Hispanic]
- Census Region (Northeast, Midwest, South, West) by Metropolitan Status (Metro, Non-metro)
- Accesses Internet by paying a cell phone company or Internet service provider (Yes, No)
- Party ID (Republican, Democrat, Independent/Other/DK/REF)
- Volunteerism (Volunteered, Did not Volunteer)
- Registered Voter (Yes, No)
- Hispanic origin (Mexican, Puerto Rican, Cuban, Spanish, All others, Non-Hispanic)
- Race/Ethnicity by Place of Birth (White Non-Hispanic, Black Non-Hispanic, Hispanic born in U.S. (not including unincorporated territories), Hispanic born in Puerto Rico, Hispanic

born in Cuba, Hispanic born in Mexico, Hispanic born elsewhere, Other/Multi-race Non-Hispanic)

- Presence of children 17 or under in the household by age group (Age 11 or under, Age 12-17, Both 11 or under and 12-17)
- Number of own children 17 or under in the household (1, 2, 3+)

The weighting benchmarks are provided by Pew Research Center. Weights are trimmed and scaled to sum to the un-weighted sample size of total respondents.

Base Weight
The ATP data was weighted in a multistep process that begins by calibrating the entire panel so that it aligns with the population benchmarks identified in the accompanying table to create a full-panel weight. For ATP waves in which only a subsample of panelists are invited to participate, a wave-specific base weight is created by adjusting the full-panel weights for subsampled panelists to account for any differential probabilities of selection for the particular panel wave. For waves in which all active panelists are invited to participate, the wave-specific base weight is identical to the full-panel weight.

Calibration to Target Population Controls
In the final stage of weighting, the ATP base weights for the panelists responding to a particular panel survey are calibrated to population benchmarks using raking, or iterative proportional fitting. This adjustment is designed to reduce the risk of nonresponse bias stemming from nonresponse at the various stages of the panel design. The raking dimensions and the source for the population parameter estimates are reported in the table below. All raking targets are based on parents who have their own children age 17 or under in their household.

Raking Dimensions and Source for Population Parameter Estimates

Raking Dimension^	Source
Gender(2) x Age(6)	2018 American Community Survey
Gender(2) x Education (3)	2018 American Community Survey
Age(3) x Education(3)	2018 American Community Survey
Education(3) x Race/Ethnicity(4)*	2018 American Community Survey
Census Region(4) by Metro Status(2)	2019 Current Population Survey ASEC March Supplement
Internet Usage(2)	2018 American Community Survey
Party Affiliation(3)	Average from the three most recent monthly surveys conducted for the Pew Research Center for the People & the Press
Volunteerism(2)	2017 CPS Volunteering and Civic Life Supplement
Registration(2)	2018 Current Population Survey Registration Supplement
Hispanic Origin (6)	2018 American Community Survey
Place of birth by Race/Ethnicity (9)	2018 American Community Survey
Presence of children 17 or under in the household by age group (3)	2018 American Community Survey
Number of own children 17 or under in the household (3)	2018 American Community Survey

^ The numbers of categories (prior to any collapsing from small cell size) are shown in parentheses.
*note that Education is collapsed for "Other/Non Hispanic"

The raking for internet usage was included in the algorithm so that the panel survey estimates reflect the target population with respect to the proportion of people who use the internet and the proportion who do not. In Wave 63, all ATP interviews were completed via self-administered web survey. Therefore, there was a concern that internet users could be over-represented in the survey estimates if this dimension was not controlled for in the raking. To correct for this potential over-representation, panelists who reported at the time of the recruitment survey that they did not use the Internet were used to represent non-Internet users in the raking. Other dimensions that are not typically used in weighting protocols for general population household surveys in the US are volunteering and voter registration. These

variables were included in the calibration to adjust for some potential bias due to the over-representation of more politically- and civically-engaged adults of the panel.

Design Effect and Margin of Error

Weighting and survey design features that depart from simple random sampling tend to result in an increase in the variance of survey estimates. This increase, known as the design effect or *deff*, should be incorporated into the margin of error, standard errors, and tests of statistical significance. The overall design effect for a survey is commonly approximated as 1 plus the squared coefficient of variation of the weights. For this survey, the margin of error (half-width of the 95% confidence interval) incorporating the design effect for full sample estimates at 50% is ± 2.2 percentage points. Estimates based on subgroups will have larger margins of error. It is important to remember that random sampling error is only one possible source of error in a survey estimate. Other sources, such as question wording and reporting inaccuracy, may contribute additional error. A summary of the weights and their associated design effect is reported in the table below.

Design Effect and Effective Sample Size

Weight Variable	Completed Interviews	Approximate Design Effect	Effective Sample Size	Margin of Error (95% confidence level)
WEIGHT_W63	3,640	1.91	1,906	±2.2 percentage points

Dispositions

The survey cooperation rate for Wave 63 itself was 66%. The final table reports the cumulative response rate for Wave 63 when all stages of recruitment or response are taken into account.

Final Dispositions for the Wave 63 Web Survey

Final Disposition	AAPOR Code[1]	ATP	KP	Total
Completed interview	1.1	3,194	446	3,640
Logged onto survey; broke-off	2.12	48	23	70
Logged onto survey; did not complete any items	2.1121	29	12	41
Never logged on (implicit refusal)	2.11	976	497	1,473
Completed interview but was removed for data quality		0	1	1
Screened out		266	21	288
Total Panelists in the Wave 63 Web Survey		**4,513**	**1,000**	**5,513**
Completed interviews	I	3,194	446	3,640

Partial interviews	P			
Refusals	R	1,053	533	1,585
Non-contact	NC			
Other	O			
Unknown household	UH			
Unknown other	UO			
Not eligible	NE	266	21	288
Total		**4,513**	**1,000**	**5,513**
AAPOR RR1 = I / (I+P+R+NC+O+UH+UO)		70.8%	44.6%	66%

Cumulative Response Rate	ATP	KP	Total
Weighted Response Rate to Recruitment Surveys^	11.4%	10.4%	11.2%
Percent of Recruitment Survey Respondents Who Agreed to Join the panel, Among Those Invited	68.0%	59.7%	66.5%
Percent of Those Agreeing to Join Who Were Active Panelists at Start of Wave 63	74.3%	43.9%	68.8%
Response Rate to Wave 63 Survey	76.7%	44.6%	70.8%
Cumulative Response Rate for the Wave 63 Survey	**4.1%**	**2.9%**	**3.4%**

^ Weighted by the total phone numbers used in each survey
